6. MASH Treatment Growth Analysis And Strategic Analysis Framework 20

6.1 Global MASH Treatment PESTEL Analysis (Political, Social, Technological, Environmental and Legal Factors) 20

6.1.1 Political 21

6.1.2 Economic 21

6.1.3 Social 22

6.1.4 Technological 23

6.1.5 Environmental 24

6.1.6 Legal 24

6.2 Analysis Of End User Industries (B2B) 25

6.2.1 Hospitals 25

6.2.2 Specialty Clinics 25

6.2.3 Homecare 25

6.2.4 Other End-User 26

6.3 MASH Treatment Market Growth Rate Analysis 27

6.4 Historic Market Growth, 2019 – 2024, Value ($ Million) 27

6.4.1 Market Drivers 2019 – 2024 29

6.4.2 Market Restraints 2019 – 2024 31

6.5 Forecast Market Growth, 2024 – 2029, 2034F Value ($ Million) 32

6.6 Forecast Growth Contributors/Factors 33

6.6.1 Quantitative Growth Contributors 33

6.6.2 Drivers 34

6.6.3 Restraints 35

6.7 MASH Treatment Total Addressable Market (TAM) 36

7. Competitive Landscape And Company Profiles 37

7.1 Company Profiles 39

7.2 *Madrigal* Pharmaceuticals Inc. 39

7.2.1 Company Overview 39

7.2.2 Products And Services 39

7.2.3 Business Strategy 39

4. Market Characteristics

4.1 General Market Definition

The market by value in this report is defined as the revenues that enterprises gain from goods and/or services sold within the specified market and geography.

- Values in this market are 'factory gate' values, that is the value of goods sold by the manufacturers or creators of the goods, whether to other entities (including downstream manufacturers, wholesalers, distributors and retailers) or directly to end customers. The value of goods in this market includes related services sold by the creators of the goods.
- The market value includes the value of related goods sold by the service provider or included within the service offering. Only goods and services traded between entities or sold to end consumers are included.

The revenues for a specified geography are consumption values – that is, they are revenues generated by organizations in the specified geography within the specified market, irrespective of where they are produced.

- It does not include revenues from resales either further along the supply chain or as part of other products.
- Value is defined as revenues generated from goods or services in a given geographic market through sales, grants or donations in terms of currency (in USD ($) unless otherwise specified).
- Only goods and services traded between entities or sold to end consumers are included.

4.2 Summary

4.3 MASH Treatment Market Definition And Segmentations

Metabolic dysfunction-associated steatohepatitis (MASH), previously known as non-alcoholic steatohepatitis (NASH), is a chronic and progressive liver disease characterized by fat accumulation, inflammation and fibrosis in the liver, primarily linked to obesity, insulin resistance, type 2 diabetes and other metabolic disorders. The primary purpose of metabolic dysfunction-associated steatohepatitis (MASH) treatment is to halt or reverse liver damage, prevent disease progression to cirrhosis or liver failure, and manage associated metabolic conditions. The treatment typically includes lifestyle interventions, pharmacotherapy, and in some cases, surgical options to reduce liver inflammation, fibrosis, and metabolic risk factors.[i]

The MASH treatment market consists of sales by entities (organizations, sole traders and partnerships) of MASH treatment drugs and therapy that is used when lifestyle modifications alone are insufficient to halt or reverse liver damage. It is utilized across a continuum of care, beginning with non-invasive interventions and progressing to pharmacological treatment or bariatric surgery in advanced cases.[ii]

Complementary interventions include nutritional counseling and physical activity programs, while substitutes may include broader metabolic treatments that indirectly address the condition. Treatment is administered in clinical settings such as hospitals and specialty clinics and increasingly through home-based care, especially for oral medications and telehealth-supported interventions.[iii]

Drugs are produced through biopharmaceutical and chemical synthesis processes involving small molecules and biologics, while therapies may encompass structured weight-loss programs or surgical interventions. These treatments are distributed through hospital pharmacies for complex or inpatient care, retail pharmacies for maintenance drugs and online pharmacies for chronic care management.[iv]

Sales occur through both institutional procurement and direct-to-consumer channels, depending on the healthcare infrastructure and insurance frameworks. Ongoing patient support involves regular liver function testing, imaging studies, biomarker monitoring and long-term care coordination by hepatologists, endocrinologists and primary care providers.[v]

The market covered in this report includes sales of MASH treatment by treatment such as drug and therapy. The market covered in this report includes sales of MASH treatment for various disease stages such as simple fatty liver / MASLD (no or mild fibrosis), early MASH (significant/advanced fibrosis), fibrotic MASH, MASH cirrhosis and liver failure / liver cancer mortality. The main end users of the market include hospitals, specialty clinics, homecare and other end-users.

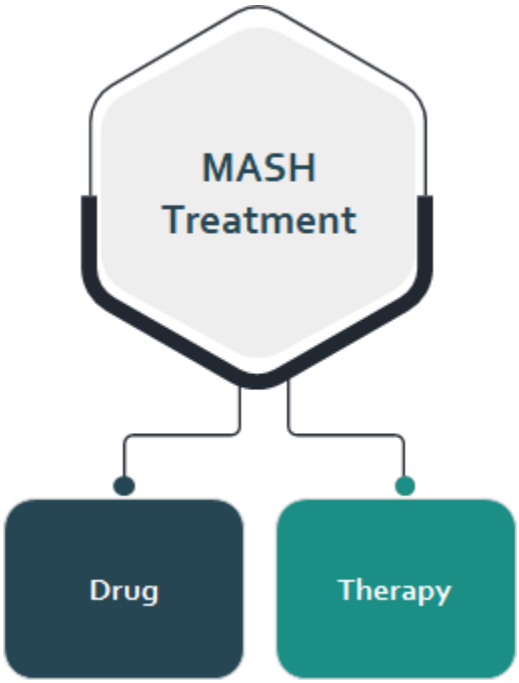

This report excludes treatments specifically for liver conditions unrelated to metabolic dysfunction, such as alcoholic liver disease, viral hepatitis, autoimmune hepatitis and genetic liver disorders. It also excludes diagnostics not directly associated with treatment, experimental or unapproved therapies. Additionally, it does not include wellness or dietary supplements marketed without clinical evidence for MASH treatment.

4.4 Market Segmentation By Treatment

The MASH treatment market is segmented by treatment into drug and therapy.

Figure 1: Global MASH Treatment Market Segmentation By Treatment

The Business Research Company
Sources: TBRC Analysis

4.4.1 Drug

The drug market consists of sales of pharmaceutical products used to treat MASH by entities that develop and commercialize medications targeting liver fat reduction, inflammation and fibrosis. These include antifibrotic agents, GLP-1 receptor agonists, farnesoid X receptor (FXR) agonists, peroxisome proliferator-activated receptor (PPAR) agonists, insulin sensitizers, antioxidants and other investigational or approved drugs.[vi]

The drugs market is sub-segmented by type into antifibrotic agents, antidiabetic drugs, lipid-lowering agents, vitamin E, obeticholic acid, GLP-1 agonists and other drugs.

4.4.1.1 Antifibrotic Agents

The antifibrotic agents market consists of sales of medications by entities that develop and commercialize drugs targeting liver fibrosis in MASH. These drugs are designed to reduce or reverse fibrotic tissue buildup, slowing disease progression and potentially improving liver function in advanced stages of MASH.[vii]

© The Business Research Company 2025, All Rights Reserved

4.4.1.2 Antidiabetic Drugs

The antidiabetic drugs market consists of sales of medications by entities that provide glucose-lowering therapies used to manage MASH. These include insulin sensitizers such as pioglitazone and metformin, which indirectly improve hepatic steatosis and insulin resistance associated with MASH.[viii]

4.4.1.3 Lipid-Lowering Agents

The lipid-lowering agents market consists of sales of drugs by entities that produce statins, fibrates and other agents used to manage dyslipidemia in MASH patients. These medications help reduce liver fat accumulation and cardiovascular risks often associated with MASH.[ix]

4.4.1.4 Vitamin E

The vitamin E market consists of sales of antioxidant therapy by entities providing high-dose tocopherol supplements used in non-diabetic MASH patients. Vitamin E reduces oxidative stress and hepatic inflammation and is one of the few non-prescription options recommended for select MASH populations.[x]

4.4.1.5 Obeticholic Acid (OCA)

The obeticholic acid market consists of sales of FXR agonist drugs by entities that produce and market OCA, a bile acid analogue developed for reducing liver fibrosis in MASH. OCA is under regulatory consideration or approved in some regions as a disease-modifying agent in MASH therapy.[xi]

4.4.1.6 Glucagon-like Peptide-1 (GLP-1) Agonists

The GLP-1 agonists market consists of sales of glucagon-like peptide-1 receptor agonists by entities providing agents such as semaglutide and liraglutide. These drugs promote weight loss, reduce liver fat content and improve insulin sensitivity in MASH patients.[xii]

4.4.1.7 Other Drugs (Anti-Inflammatory Agents)

The other drugs market consists of sales of investigational or off-label anti-inflammatory agents by entities targeting hepatic inflammation in MASH. This includes a range of compounds under clinical development aimed at modulating immune response and cytokine activity.[xiii]

4.4.2 Therapy

The therapy market consists of sales of non-pharmaceutical treatments for MASH by entities providing lifestyle interventions, weight management programs, nutritional therapy, behavioral counseling and bariatric procedures. These therapies are essential in early-stage MASH management and serve as adjuncts to pharmacological interventions.[xiv]

The therapy market is sub-segmented by type into lifestyle modifications, bariatric surgery and liver transplantation.

4.4.2.1 Lifestyle Modifications (Dietary Changes, Exercise)

The lifestyle modifications market consists of sales of services and programs by entities that promote diet and exercise interventions to manage MASH. These therapies aim to reduce liver fat and improve insulin resistance through calorie restriction, physical activity and behavioral changes.[xv]

© The Business Research Company 2025, All Rights Reserved

4.4.2.2 Bariatric Surgery

The bariatric surgery market consists of sales of surgical weight-loss procedures by entities offering interventions such as gastric bypass or sleeve gastrectomy. These are indicated in obese MASH patients when conservative measures fail, with demonstrated benefits in reducing hepatic steatosis and improving liver histology.[xvi]

4.4.2.3 Liver Transplantation

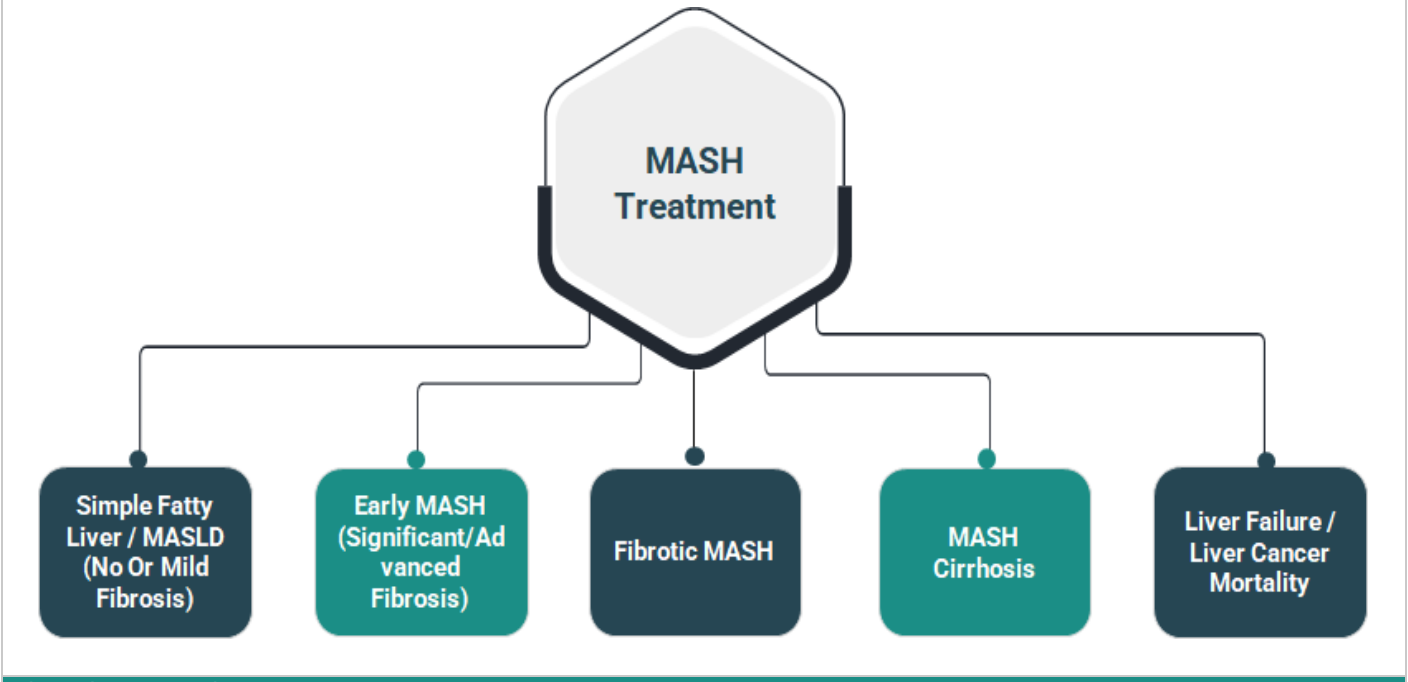

The liver transplantation market consists of sales of surgical and post-operative services by entities providing liver transplant procedures for end-stage MASH. This therapy is reserved for patients with decompensated cirrhosis or hepatocellular carcinoma resulting from MASH progression.[xvii]

© The Business Research Company 2025, All Rights Reserved

4.5 Market Segmentation By Disease Stage

The MASH treatment market is segmented by disease stage into simple fatty liver / MASLD (no or mild fibrosis), early MASH (significant/advanced fibrosis), fibrotic MASH, MASH cirrhosis and liver failure / liver cancer mortality.

Figure 2: Global MASH Treatment Market Segmentation By Disease Stage

The Business Research Company
Sources: TBRC Analysis

4.5.1 Simple Fatty Liver / MASLD (No Or Mild Fibrosis)

The simple fatty liver/ MASLD segment consists of sales of drugs and therapy used to treat early-stage metabolic dysfunction-associated steatotic liver disease (MASLD) characterized by liver fat accumulation with no or mild fibrosis. Treatments primarily focus on metabolic control, weight reduction and insulin sensitization using agents such as GLP-1 receptor agonists, peroxisome proliferator-activated receptor agonists and lifestyle intervention adjuncts.[xviii]

4.5.2 Early MASH (Significant/Advanced Fibrosis)

The early MASH segment consists of sales of drugs and therapy targeting patients with early metabolic dysfunction-associated steatohepatitis (MASH) and significant to advanced liver fibrosis (typically F2-F3 stages). Therapies in this segment aim to reduce hepatic inflammation and slow fibrosis progression, often using antifibrotic agents, FXR agonists and investigational combination therapies.[xix]

© The Business Research Company 2025, All Rights Reserved

4.5.3 Fibrotic MASH

The fibrotic MASH segment consists of sales of drugs and therapy designed for patients with progressive fibrosis resulting from untreated or advanced MASH. Treatments focus on halting or reversing fibrotic changes in the liver using specialized antifibrotic compounds, immune modulators and agents that target liver cell injury and fibrogenic pathways.[xx]

4.5.4 MASH Cirrhosis

The MASH Cirrhosis segment consists of sales of drugs and therapy for the treatment of cirrhosis caused by long-standing MASH, where irreversible liver scarring leads to compromised liver function. Therapies aim to manage complications such as portal hypertension, ascites and hepatic encephalopathy, using advanced pharmacologic interventions and preparing patients for potential liver transplantation.[xxi]

4.5.5 Liver Failure / Liver Cancer Mortality

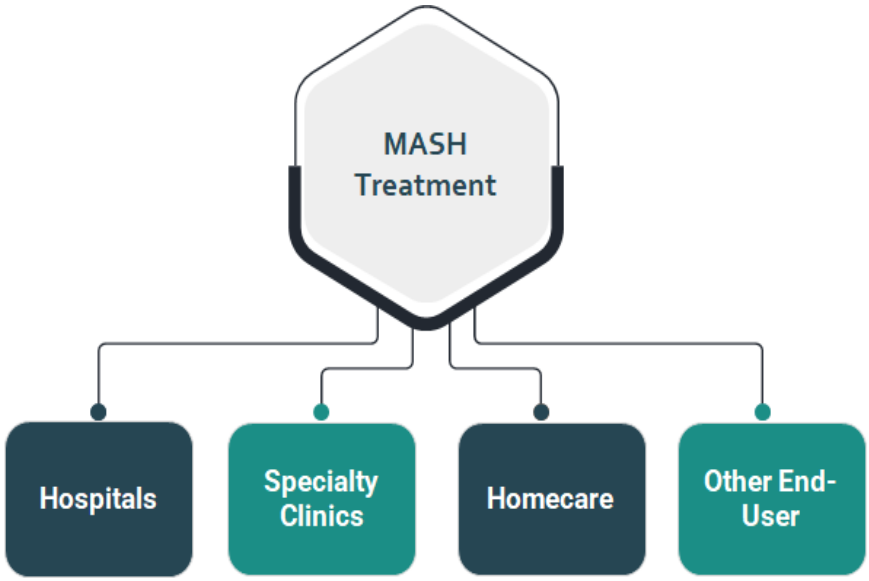

The liver failure / liver cancer mortality segment consists of sales of drugs and therapy for end-stage liver disease and hepatocellular carcinoma (HCC) resulting from MASH progression. Treatments may involve targeted cancer therapies, systemic chemotherapy, immunotherapy and palliative care aimed at managing symptoms, prolonging survival, or improving quality of life in terminal stages.[xxii]

© The Business Research Company 2025, All Rights Reserved

4.6 Market Segmentation By End-User

The MASH treatment market is segmented by end-user into hospitals, specialty clinics, homecare and other end-user.

Figure 3: Global MASH Treatment Market Segmentation By End-User

The Business Research Company
Sources: TBRC Analysis

4.6.1 Hospitals

The hospitals market consists of sales of MASH treatment services provided by entities operating in general and specialized hospital facilities. These services include inpatient care, advanced diagnostic evaluations such as liver biopsies or elastography, intravenous drug administration and comprehensive management by multidisciplinary teams addressing metabolic and hepatic complications.[xxiii]

4.6.2 Specialty Clinics

The specialty clinics market consists of sales of MASH treatment services provided by entities that operate dedicated hepatology, gastroenterology, endocrinology, or obesity clinics. These clinics offer specialized consultations, disease staging, individualized treatment plans and routine follow-up care, often using non-invasive diagnostic tools and targeted therapeutic approaches.[xxiv]

4.6.3 Homecare

The homecare market consists of sales of MASH treatment services provided by entities that support at-home management of the disease. This includes home delivery of medications, telehealth consultations with metabolic or liver specialists, remote monitoring of liver function and comorbid conditions and patient education for lifestyle modifications and medication adherence.[xxv]

© The Business Research Company 2025, All Rights Reserved

4.6.4 Other End-User

The other end-user market consists of sales of MASH treatment services provided by entities not categorized under hospitals, specialty clinics, or homecare. These may include public health organizations, corporate wellness programs, academic research centers conducting clinical trials and community-based outreach initiatives that deliver preventive and supportive care for MASH.[xxvi]

© The Business Research Company 2025, All Rights Reserved

5. Major Market Trends

Major trends shaping the MASH treatment market include the following:

5.1 Advancements In Fibroblast Growth Factors (FGFs) Through Acquisitions

Major companies operating in the MASH treatment market are focusing on advancing fibroblast growth factor to strengthen their market position. Fibroblast growth factor 21 (FGF21) is a hormone-like protein that regulates lipid, glucose and energy metabolism in the body. FGF21 analogs have shown promise by reducing liver fat, inflammation and fibrosis, thus improving liver health and helping to resolve MASH without worsening fibrosis. These effects make FGF21-based therapies a leading strategy for addressing the metabolic and fibrotic complications of MASH. For example, in May 2025, GlaxoSmithKline (GSK), a UK-based pharma company acquired Efimosfermin (also known as efimosfermin alfa), a once-monthly fibroblast growth factor 21 (FGF21) from Boston Pharmaceuticals, a US-based pharma company. Efimosfermin is designed to provide direct antifibrotic action, aiming to reverse liver fibrosis and halt the progression of Metabolic Dysfunction-Associated Steatohepatitis (MASH), including cases that have advanced to cirrhosis. In addition to MASH, the therapy is being developed for alcohol-related liver disease (ALD) and both forms of steatotic liver disease (SLD), broadening its potential impact on serious liver conditions. GSK plans to explore efimosfermin both as a monotherapy and in combination with other investigational agents, including their siRNA therapeutic for liver disease. The acquisition and development of efimosfermin position GSK as a significant player in the evolving market for innovative liver disease therapies.[xxvii]

© The Business Research Company 2025, All Rights Reserved

5.2 Integration Of Artificial Intelligence (AI) In MASH Treatment

Major companies operating in the MASH treatment market are focusing on integration of artificial intelligence (AI) in MASH treatment market to enhance precision in disease assessment and treatment outcomes. Companies are increasingly leveraging AI to support non-invasive, accurate evaluation of liver fibrosis, a key factor in MASH progression. For instance, in March 2025, HistoIndex, a Singapore based company engaged in stain-free digital pathology solutions for managing fibrotic diseases, has announced the launch of their first Laboratory Developed Test (LDT) FibroSIGHT. FibroSIGHT seamlessly integrates into routine clinical workflows, leveraging on HistoIndex's proprietary stain-free imaging technology to enhance the sensitivity of fibrillar collagens detection — key in evaluating fibrosis severity in liver biopsy samples. By eliminating variability associated with traditional staining techniques, FibroSIGHT delivers reliable and precise fibrosis assessment for MASH patients.[xxviii] Also, in February 2025, Insilico Medicine, a US based clinical-stage generative artificial intelligence (AI)-driven drug discovery company, achieved preclinical milestone in its collaboration with Therasid Bioscience, a South Korean based biotechnology company focuses on developing innovative first-in-class drugs for treatment for metabolic dysfunction-associated steatohepatitis (MASH). Insilico's team synthesized and tested approximately 40 molecules by leveraging its proprietary AI-powered generative chemistry engine, Chemistry42.[xxix]

5.3 Strategic Partnerships And Collaborations Among Market Players

Companies in the MASH treatment market are adopting a strategic partnership approach for business expansion in the market. Strategic partnerships enable companies to leverage each other's strengths and resources to achieve mutual benefits and success. For example, in April 2024, Boehringer, a Germany-based pharmaceutical company actively involved in developing treatments for metabolic dysfunction-associated steatohepatitis (MASH), entered a multi-year collaboration with Ochre Bio, a UK-based biotech, to develop RNA therapies targeting chronic liver diseases, with a primary focus on MASH. The deal includes $35 million upfront and potential milestones exceeding $1 billion. The partnership aim is to identify, characterize and validate multiple novel regenerative targets that could enhance the liver's self-repair capabilities, potentially halting or reversing disease progression in MASH and other chronic liver diseases.[xxx] Further, in January 2024, Suzhou Ribo Life Science Co., Ltd., a China-based clinical-stage company and Ribocure Pharmaceuticals AB (Ribo), a Sweden-based clinical-stage biotechnology company, announced a collaboration with Boehringer Ingelheim for $2 billion. This partnership aims to develop innovative treatments for nonalcoholic steatohepatitis (NASH) and metabolic dysfunction-associated steatohepatitis (MASH) by combining Ribo's RNAi therapeutic platform with Boehringer Ingelheim's expertise in cardiovascular, renal and metabolic diseases. The collaboration focuses on addressing the urgent need for effective therapies to halt NASH progression and restore liver function. Boehringer Ingelheim is a Germany-based pharmaceutical company actively involved in developing treatments for metabolic dysfunction-associated steatohepatitis (MASH).[xxxi]

© The Business Research Company 2025, All Rights Reserved

5.4 Focus On Receiving Government Approvals To Highlight Advancements in MASH Treatment

Major companies operating in the MASH treatment market are intensifying their efforts to secure regulatory approvals for their novel therapies. Achieving approvals from the government is a key strategy to accelerate development timelines and enhance market competitiveness. These approvals not only validate the clinical potential of their drug candidates but also position companies to capture early market share in a rapidly evolving therapeutic landscape. For example, in October 2024, Boehringer Ingelheim is a Germany-based pharmaceutical company actively involved in developing treatments for metabolic dysfunction-associated steatohepatitis (MASH), received approval from the US Food and Drug Administration (FDA) to their investigational drug survodutide for the treatment of adults with non-cirrhotic metabolic dysfunction-associated steatohepatitis (MASH) and moderate to advanced fibrosis. This designation was awarded based on compelling Phase II clinical trial results that demonstrated significant improvements in liver health compared to existing therapies. Specifically, up to 83% of patients treated with survodutide showed a marked improvement in MASH, with a placebo-adjusted difference of 64.8%, alongside notable reductions in liver fibrosis. The Breakthrough Therapy status is intended to expedite the development and review process, reflecting the FDA's recognition of survodutide's potential to address a critical unmet medical need in MASH patients.[xxxii]

5.5 Innovative MASH Treatments Address Fibrosis And Improve Liver Health Outcomes

Major companies operating in the MASH treatment market are focusing on developing innovative products such as liver fibrosis treatment solutions to provide the treatment option for patients with metabolic dysfunction-associated steatohepatitis (MASH) and moderate to severe liver fibrosis. Liver fibrosis treatment solutions focus on addressing the underlying causes of liver damage through lifestyle modifications, antiviral medications and emerging antifibrotic therapies, aiming to halt or reverse the progression of fibrosis and improve liver function. For example, in March 2024, Madrigal Pharmaceuticals, Inc., a US-based biopharmaceutical company, announced the FDA approval of Rezdiffra (resmetirom), the first-ever treatment for metabolic dysfunction-associated steatohepatitis (MASH) with moderate to severe liver fibrosis. Rezdiffra is a daily oral tablet that demonstrated efficacy in resolving MASH without worsening fibrosis and improving liver fibrosis in phase 3 clinical trials. This breakthrough offers a non-invasive treatment alternative, eliminating the need for liver biopsies and significantly improves patient access and outcomes in managing fatty liver disease.[xxxiii]

6. MASH Treatment Growth Analysis And Strategic Analysis Framework

6.1 Global MASH Treatment PESTEL Analysis (Political, Social, Technological, Environmental and Legal Factors)

A PESTEL analysis covers the political, economic, social, technological, environmental and legal factors affecting a market. Particularly important factors in the MASH treatment include reimbursement frameworks and health budget allocation. AI-driven diagnostic and pathology tools are driving the MASH treatment market. The figure below shows the PESTEL analysis for the MASH treatment industry –

Figure 4: Global MASH Treatment Market, PESTEL (Political, Economic, Social, Technology, Environmental and Legal) Analysis

The Business Research Company
Sources: TBRC Analysis

© The Business Research Company 2025, All Rights Reserved

6.1.1 Political

Reimbursement Frameworks And Health Budget Allocation

Reimbursement frameworks and health budget allocation play a pivotal role in shaping the commercial success of metabolic dysfunction-associated steatohepatitis (MASH) treatment therapies. Government and private insurers' decisions on drug coverage, pricing negotiations and formulary inclusion directly impact patient access and affordability. In a market where treatment costs can be substantial, favorable reimbursement policies are critical to driving adoption and ensuring equitable access to newly approved therapies. For example, in August 2024, Madrigal Pharmaceuticals, a US-based biopharmaceutical company reported that over 50% of commercial insurance lives in the U.S. now had coverage in place for Rezdiffra (resmetirom), with fewer than 5% of those covered requiring invasive liver biopsy—an impressive milestone in the drug's reimbursement rollout.[xxxiv]

Impact Of Trade War And Tariff

Trade wars and tariffs can significantly impact the MASH treatment market by disrupting the global supply chain of active pharmaceutical ingredients (APIs), diagnostic tools and manufacturing equipment—many of which are sourced internationally. Heightened tariffs between key trading partners such as the U.S. and China may lead to increased production costs for pharmaceutical companies, potentially delaying drug availability or inflating treatment prices. This geopolitical friction can hinder cross-border clinical trials, limit technology transfer and affect patient access to affordable therapies in both developed and emerging markets. For example, in April 2025, Merck, U.S. pharmaceutical giant revealed that it would incur an additional US $200 million in tariff-related costs this year, primarily due to increased levies on imported active pharmaceutical ingredients, ultimately driving up production expenses and contributing to higher drug prices across the market.[xxxv]

6.1.2 Economic

Impact Of Interest Rate Fluctuations

Interest rate fluctuations can significantly influence the MASH treatment market by affecting capital availability, investment decisions and R&D financing for pharmaceutical companies. Higher interest rates increase the cost of borrowing, which may lead to reduced funding for clinical trials, manufacturing expansion and market access initiatives. This can slow the development and commercialization of innovative MASH therapies. Conversely, lower interest rates encourage greater investment in biotech ventures and infrastructure, accelerating drug pipeline progress and market growth. For example, in April 2025, the U.S. biotech sector, including companies working on MASH treatments— was hit by a "deeper slump" as high interest rates, combined with NIH budget freezes and Food and Drug Administration (FDA) staffing cuts, severely disrupted funding access. Around 30% of small- and mid-cap biotech firms were trading at or below cash value, underscoring how elevated borrowing costs and risk aversion among investors have constrained capital flow into long-term drug development.[xxxvi]

© The Business Research Company 2025, All Rights Reserved

Impact Of Inflationary Pressures

Inflationary pressures affect the MASH treatment market by driving up the costs of raw materials, labor, manufacturing and logistics, thereby increasing the overall expense of drug development and distribution. These rising costs can lead to higher treatment prices, placing a strain on healthcare budgets and limiting patient access, especially in low- and middle-income regions. Additionally, inflation may prompt payers to tighten reimbursement policies, impacting market uptake of newly approved therapies. For example, in February 2025, Vizient, a US-based healthcare performance improvement company highlighted that pharmacy spending, including for specialty medications like those used in MASH treatment, increased by 3.8%, driven by inflationary pressures across raw materials, labor, manufacturing, freight and supply chain costs. This uptick reflects how broader price inflation is directly raising the cost of bringing MASH therapies to market, potentially impacting their affordability and accessibility.[xxxvii]

6.1.3 Social

Impact Of The COVID-19 Pandemic And Recovery

The COVID-19 pandemic disrupted clinical trials, delayed regulatory reviews and strained global supply chains, slowing the development of MASH treatments. Many healthcare resources were redirected toward managing the pandemic, deprioritizing non-urgent conditions like MASH. However, the post-pandemic recovery has renewed focus on metabolic health, with rising obesity and diabetes rates—exacerbated by pandemic-related lifestyle changes—driving increased demand and investment in ***MASH*** diagnostics and therapeutics. For example, in February 2022, ***Madrigal*** Pharmaceuticals, a US-based biopharmaceutical company in its annual Securities and Exchange Commission (SEC) filing, reported that the COVID-19 pandemic had disrupted patient screening and enrollment for its Phase 3 MAESTRO-NASH trial of resmetirom. The company cited quarantine restrictions and patient hesitancy toward liver biopsies as key factors slowing trial progress. This highlighted how pandemic-related delays directly impacted MASH drug development timelines.[xxxviii]

Low Awareness And Late Diagnosis

In the MASH treatment market, low public awareness and the asymptomatic nature of early-stage disease contribute to widespread under diagnosis. Many patients are not identified until advanced fibrosis or cirrhosis sets in, reducing treatment effectiveness and increasing long-term healthcare costs. This social barrier delays market uptake for emerging therapies and limits early intervention opportunities. For example, in February 2025, MedPath, a US-based medical intelligence platform, published a large real-world study analyzing 18,396 newly diagnosed MASH patients in the United States. The study found that only about 10% underwent a liver biopsy, with most diagnoses occurring through incidental lab tests or imaging—highlighting how low disease awareness and reliance on non-invasive methods contribute to delayed and unintentional diagnoses in clinical practice.[xxxix]

© The Business Research Company 2025, All Rights Reserved

6.1.4 Technological

AI-Driven Diagnostic And Pathology Tools

Artificial intelligence is revolutionizing the MASH treatment market by enhancing the accuracy, consistency and scalability of liver disease diagnostics. AI-powered tools assist pathologists in interpreting biopsy data more objectively, reducing inter-reader variability and improving clinical trial efficiency. These innovations are critical for accelerating drug development and standardizing diagnostic criteria across global research sites. For example, in August 2024, PathAI, a US-based biotechnology company, announced the launch of AIM-MASH, an advanced AI-based measurement tool for assessing Metabolic Dysfunction-Associated Steatohepatitis (MASH), on its AISight Image Management System (IMS). This product is designed to support pathologists in the analysis of the MASH Clinical Research Network (CRN) Metabolic Dysfunction-Associated Steatotic Liver Disease (MASLD) Activity Score (MAS) component grades and fibrosis staging. AIM-MASH uses AI to standardize and automate the scoring of liver biopsies for MASH, addressing variability and improving the reproducibility and scalability of pathologists' assessments. AIM-MASH has been validated across multiple sites and diverse datasets from four different trials and has already been featured in over 20 presentations and publications, demonstrating its effectiveness in clinical research and pathology labs.[xl]

Advancement In Non-Invasive Therapeutic Technologies

The MASH treatment market is experiencing a significant shift toward non-invasive therapeutic options, reducing reliance on liver biopsies for both diagnosis and treatment monitoring. These innovations improve patient accessibility, adherence and clinical efficiency, especially as healthcare systems prioritize scalable and less burdensome interventions. As a result, non-invasive therapies are driving faster adoption and broader reach across at-risk populations. For instance, in March 2024, Madrigal Pharmaceuticals, Inc., a U.S.-based biopharmaceutical company, received FDA approval for Rezdiffra (resmetirom), the first approved treatment for metabolic dysfunction-associated steatohepatitis (MASH) with moderate to severe liver fibrosis. Rezdiffra is a once-daily oral medication that demonstrated strong efficacy in Phase 3 trials by resolving MASH without worsening fibrosis and significantly improving liver fibrosis. This milestone introduces a non-invasive therapeutic option, eliminating the need for liver biopsy and enhancing both patient access and clinical outcomes in managing fatty liver disease.[xli]

© The Business Research Company 2025, All Rights Reserved

6.1.5 Environmental

Chemical Exposure And Metabolism-Disrupting Agents

Chemical exposure to endocrine disruptors and metabolism-altering agents such as microplastics, phthalates and industrial pollutants has emerged as a critical environmental driver of metabolic dysfunction-associated steatohepatitis (MASH). These agents trigger hepatic inflammation, oxidative stress and fibrosis—mimicking or exacerbating metabolic disease progression. This evolving threat is pushing the MASH treatment market toward developing therapies that not only target metabolic pathways but also mitigate toxin-induced liver damage, expanding the scope of drug innovation and regulatory oversight. Metabolomic and metagenome analysis indicated abnormalities in hepatic bile acid metabolism and significant alterations in the gut microbiota after exposure to PS-MPs (polystyrene microplastics). These alterations led to increased disruption of the intestine-liver axis.[xlii] The liver communicates with the intestine, in large part through the gut microbiota. Microbial enzymes are key mediators that affect the progression of metabolic dysfunction-associated steatotic liver disease (MASLD) and the more severe metabolic dysfunction-associated steatohepatitis (MASH). This highlights how environmental chemical exposures can directly alter hepatic metabolic pathways and promote MASH development, reinforcing the need for treatment strategies that address toxin-mediated liver injury.[xliii]

6.1.6 Legal

Regulatory Approval Pathways And Conditional Authorizations

Regulatory approval pathways and conditional authorizations play a critical role in shaping the MASH treatment market. These frameworks allow promising therapies to reach patients faster, especially in areas of high unmet medical need, while requiring companies to meet post-marketing commitments. Such mechanisms not only accelerate commercialization but also impose legal and clinical obligations that impact long-term market access and compliance strategies. For example, in June 2025, the European Medicines Agency (EMA) issued a conditional marketing authorization for Rezdiffra (resmetirom)—the first-ever approved drug for metabolic dysfunction-associated steatohepatitis (MASH) in Europe. This milestone allowed patients to access the treatment ahead of full data review, while legally binding ***Madrigal*** Pharmaceuticals to complete post-marketing confirmatory trials in compliance with EMA regulations.[xliv]

© The Business Research Company 2025, All Rights Reserved

6.2 Analysis Of End User Industries (B2B)

6.2.1 Hospitals

The hospitals is a key end-user of the MASH treatment market driven by the increasing prevalence of advanced liver diseases requiring inpatient care, rising hospital admissions due to obesity- and diabetes-related complications, growing availability of specialized diagnostic and therapeutic infrastructure, increased adoption of combination drug therapies managed under clinical supervision, enhanced funding and reimbursement support for liver-related treatments and the presence of multidisciplinary teams that enable comprehensive disease management including hepatology, endocrinology and dietetics.[xlv] For instance, in March 2024, Madrigal Pharmaceuticals Inc., a US-based biopharmaceutical company, announced the FDA approval of Rezdiffra (resmetirom), the first-ever treatment for metabolic dysfunction-associated steatohepatitis (MASH) with moderate to severe liver fibrosis. Rezdiffra is a daily oral tablet that demonstrated efficacy in resolving MASH without worsening fibrosis and improving liver fibrosis in phase 3 clinical trials. This breakthrough offers a non-invasive treatment alternative, eliminating the need for liver biopsies and significantly improves patient access and outcomes in managing fatty liver disease.[xlvi]

6.2.2 Specialty Clinics

The specialty clinics is also an end-user of the MASH treatment market, driven by the growing demand for targeted and personalized liver disease management, increasing referrals from primary care for specialized MASH diagnosis and treatment, rising availability of non-invasive diagnostic tools such as FibroScan and imaging within clinics, focus on early intervention to prevent progression to cirrhosis, integration of lifestyle modification programs alongside pharmacological therapies and the growing patient preference for outpatient care settings offering convenience and specialized attention.[xlvii] For instance, in May 2024, 89bio Inc., a US-based biotech company, launched its Phase III trial of pegozafermin, a glycopegylated analog of fibroblast growth factor 21 (FGF21), aimed at treating MASH. The trial, known as ENLIGHTEN-Cirrhosis, targets patients with compensated cirrhosis due to MASH and is being conducted in specialized liver and metabolic clinics across the U.S. and Europe. This reflects how specialty clinics are instrumental in advancing MASH therapy through direct involvement in novel drug development and clinical research.[xlviii]

6.2.3 Homecare

The homecare is also an end-user of the MASH treatment market driven by the rising preference for at-home disease management among elderly and chronically ill patients, increasing availability of remote monitoring tools and telehealth services, growing adoption of oral and non-invasive therapeutic regimens suitable for home administration, cost-effectiveness of homecare compared to hospital-based treatments, enhanced caregiver support and education programs and the expanding role of digital health platforms in enabling medication adherence and lifestyle management from home.[xlix] For instance, in May 2025, Akero Therapeutics Inc., a US-based biotechnology company, announced the Symmetry Trial Phase 2b in the New England Journal of Medicine. The trial demonstrated statistically significant improvements in liver histology, including fibrosis reduction and resolution of MASH, with a favorable safety profile. This mode of delivery is well-suited for self-administration at home, eliminating the need for frequent hospital or clinic visits. Akero specifically highlights the convenience and feasibility of home-based treatment in its trial outcomes, reflecting a design intended for use in a homecare setting.[l]

© The Business Research Company 2025, All Rights Reserved

6.2.4 Other End-User

The other end-users includes research institutions, academic medical centers and dedicated clinical trial facilities is an end-user of the MASH treatment market, driven by the involvement of academic and research institutions in clinical trials and drug development, increasing role of contract research organizations (CROs) in testing novel MASH therapies, pharmaceutical companies conducting large-scale population studies, growing use of MASH treatments in wellness centers and preventive care programs and government or non-profit health organizations facilitating community-based interventions and awareness campaigns for early detection and lifestyle-based management of MASH.[li] For instance, in October 2024, C.H. Boehringer Sohn AG & Co. KG, a Germany-based pharmaceutical company, received the U.S. FDA Breakthrough Therapy designation and started two phase III trials for survodutide in MASH. This designation underscores the drug's potential to provide substantial improvement over existing therapies for MASH, a progressive liver disease with limited treatment options. Notably, the company has initiated two Phase III clinical trials, signaling strong confidence in survodutide's efficacy and safety profile. The trials aim to evaluate its potential in improving liver histology and reducing fibrosis in patients with MASH.[lii]

6.3 MASH Treatment Market Growth Rate Analysis

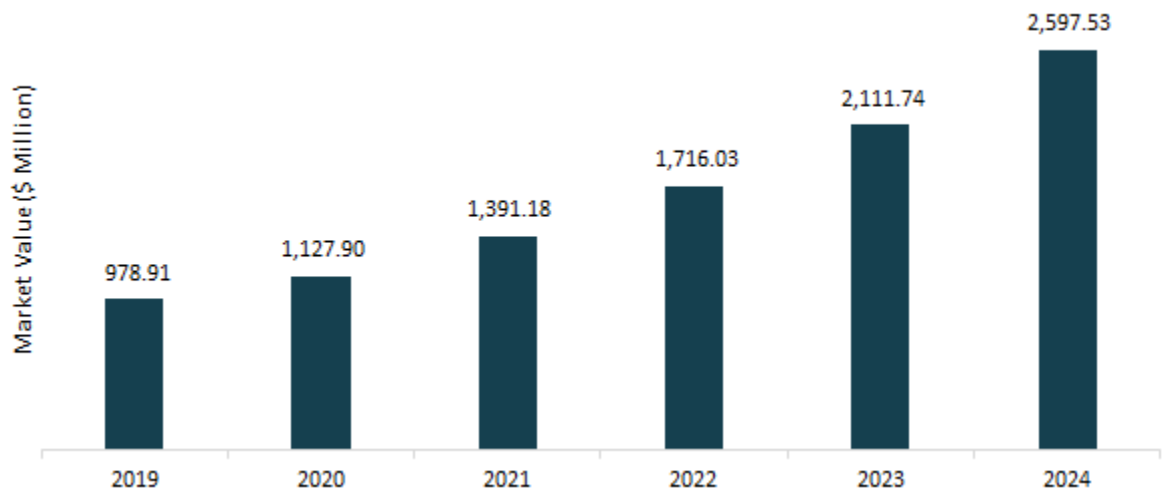

The global MASH treatment market was valued at $2,597.53 million in 2024. The market accounted for 0.002% of the global GDP. In terms of per capita consumption, the market accounted for $0.33.

The global MASH treatment market is supported by the large interest in combination therapies and high research and development (R&D) spending in life sciences. For example, in April 2023, the Inter-American Development Bank (IDB), a US-based international development finance institution, approved a $200 million loan to enhance Argentina's healthcare system. This financing marks the first operation under a conditional credit line for investment projects (CCLIP), which totals $600 million.[liii] Increased research and development (R&D) investments allow pharmaceutical and biotechnology companies to identify and develop innovative therapeutic drug candidates that specifically target the underlying causes of Metabolic Dysfunction-Associated Steatohepatitis (MASH), including liver inflammation, fibrosis and metabolic abnormalities.

6.4 Historic Market Growth, 2019 – 2024, Value ($ Million)

The chart and table below show the year-on-year growth of the global MASH treatment historic market during 2019 – 2024.

Figure 5: MASH Treatment Market, Historic, 2019 – 2024, $ Million

The Business Research Company
Sources: National Statistics Offices, UN Comtrade, TBRC Analysis, TBRC Estimates, TBRC Secondary

© The Business Research Company 2025, All Rights Reserved

Table 1: MASH Treatment Market, Historic, 2019 – 2024, $ Million

Market	2019	2020	2021	2022	2023	2024	HCAGR (2019 – 2024)
MASH Treatment	978.91	1,127.90	1,391.18	1,716.03	2,111.74	2,597.53	21.55%

The Business Research Company
Sources: National Statistics Offices, UN Comtrade, TBRC Analysis, TBRC Estimates, TBRC Secondary

The global MASH treatment market grew from $978.91 million in 2019 to $2,597.53 million in 2024 at a compound annual growth rate (CAGR) of 21.55%. The exponential growth in the historic period can be attributed to the rise in research and development (R&D) spending in life sciences, supportive government initiatives, growth in awareness and screening programs and rise in demand for personalized medicine. For example, in October 2022, the Personalized Medicine Coalition, a US-based organization that represents scientists, patients and providers, promoting the understanding and adoption of personalized medicine to benefit patients and the healthcare system, estimated that more than 75,000 genetic testing products and 300 personalized medicines are on the market for people with multiple types of cancers, genetic rare diseases and a range of chronic and infectious diseases.[liv] Personalized medicine facilitates the development of treatment strategies that are specifically tailored to an individual's genetic profile. In the context of Metabolic Dysfunction-Associated Steatohepatitis (MASH), where the progression of the disease can differ significantly between patients, the use of genetic and biomarker-based therapies enables more targeted and effective treatment approaches.

6.4.1 Market Drivers 2019 – 2024

Key Drivers
Rising Research And Development (R&D) Spending In Life Sciences
Rising Demand For Personalized Medicine
Supportive Government Initiatives
Growing Awareness And Screening Programs

Key Restraints
Stringent And Complex Regulatory Requirements
Limited Awareness Among General Population

The key drivers of the MASH treatment market during 2019-2024 included:

Rising Research And Development (R&D) Spending In Life Sciences

Rising research and development (R&D) spending in life sciences fueled the growth of the MASH treatment in the historic period. MASH, a progressive liver disease linked to metabolic disorders like obesity and diabetes, has seen a surge in prevalence globally, driving pharmaceutical and biotech firms to invest heavily in novel therapeutics. Enhanced R&D funding has enabled breakthroughs in understanding disease mechanisms, such as lipid metabolism dysregulation, inflammation and fibrosis, leading to targeted drug development. Innovations in biomarkers, genetic research and preclinical models have accelerated drug discovery, while clinical trials for promising candidates like FXR agonists, THR-β agonists and GLP-1 receptor agonists have expanded. For instance, in July 2024, according to the GOV.UK, a UK-based government department, in 2022, the business enterprise sector conducted £9.0 billion ($11.7 billion) in pharmaceutical R&D, representing 0.36% of the UK's GDP. Pharmaceutical R&D made up 18% of all R&D carried out by businesses in the UK, the highest percentage among all product areas.[lv] Therefore, the rising research and development (R&D) spending in life sciences drove the growth of the MASH treatment market.

Rising Demand For Personalized Medicine

Rising demand for personalized medicine fuelled the growth of the MASH treatment in the historic period. MASH is a complex and heterogeneous disease influenced by genetic, metabolic and environmental factors, making a one-size-fits-all treatment approach ineffective. Advances in genomics, biomarker research and artificial intelligence (AI)-driven diagnostics have enabled the identification of distinct disease subtypes, allowing for precision therapies that address specific molecular pathways, such as lipid metabolism, inflammation, or fibrosis. Pharmaceutical companies are increasingly investing in stratified clinical trials and companion diagnostics to match patients with the most effective treatments, such as FXR agonists for bile acid regulation or thyroid hormone receptor beta (THR-β) agonists for metabolic dysfunction. For instance, in February 2024, the Personalized Medicine Coalition, a US-based non-profit organization, in 2023, the FDA approved 16 new personalized treatments for rare disease patients, an increase from six in 2022. Among these approvals, seven were cancer drugs, while three targeted other diseases and conditions.[lvi] Therefore, the rising demand for personalized medicine drove the growth of the MASH treatment market.

© The Business Research Company 2025, All Rights Reserved

Favorable Government Initiatives

During the historic period, the MASH treatment market was mainly driven by the favorable government initiatives. Recognizing the rising prevalence of MASH linked to obesity, diabetes and metabolic syndrome, governments and regulatory bodies worldwide have implemented policies to accelerate drug development, improve diagnosis and enhance patient access to therapies. Incentives such as orphan drug designations, fast-track approvals and grants for research have encouraged pharmaceutical companies to invest in novel MASH treatments. For example, in March 2023, the UK government, through NHS England, provided the majority of healthcare and launched a pilot scheme to check for liver damage in high-risk communities using mobile trucks that visit general practitioner, recovery services, food banks, diabetes clinics, sexual health clinics and homeless shelters. These non-invasive scans target adults with high alcohol consumption, viral hepatitis, or non-alcoholic liver disease, aiming to scan 22,000 people in the first year.[lvii] Therefore, the MASH treatment market was mainly driven by the favorable government initiatives.

Growing Awareness And Screening Programs

Growing awareness and screening programs fuelled the growth of the MASH treatment in the historic period. As public health initiatives and medical societies highlight the risks of MASH, particularly its links to obesity, diabetes and metabolic syndrome, more individuals at risk are undergoing diagnostic evaluations. Improved non-invasive screening tools, such as elastography (FibroScan) and biomarker panels, have made detection easier and more accessible, identifying patients before advanced liver fibrosis develops. For example, in 2024, according to Blue Matter Consulting, a US-based business management consultant, adult obesity prevalence reached 40.3%, and more than 38 million Americans are living with diabetes, with about 90% to 95% having type 2 diabetes. This surge in underlying risk factors has led to an estimated 17.5 million prevalent MASH cases in the U.S. in 2024.[lviii] Therefore, the growing awareness and screening programs drove the growth of the MASH treatment market.

© The Business Research Company 2025, All Rights Reserved

6.4.2 Market Restraints 2019 – 2024

The key restraints on the MASH treatment market during 2019-2024 included:

Stringent And Complex Regulatory Requirements

Stringent and complex regulatory requirements are expected to limit the growth of the MASH treatment market in the historic period. MASH is a progressive disease with heterogeneous patient populations and variable disease progression, making clinical trial design and endpoint selection challenging. Regulatory agencies like the FDA and EMA demand robust histological evidence (e.g., fibrosis improvement without worsening of NASH) for approval, requiring long, expensive trials with invasive liver biopsies. For instance, according to FDA, a responsible for protecting and promoting public health, the FDA's accelerated approval pathway allows for conditional approval of MASH therapies based on surrogate endpoints—such as resolution of steatohepatitis or improvement in fibrosis—for F1-F3 patients, but mandates confirmatory long-term outcomes studies to secure full approval.[lix] Therefore, stringent and complex regulatory requirements may hinder the growth of the MASH treatment market.

Limited Awareness Among General Population

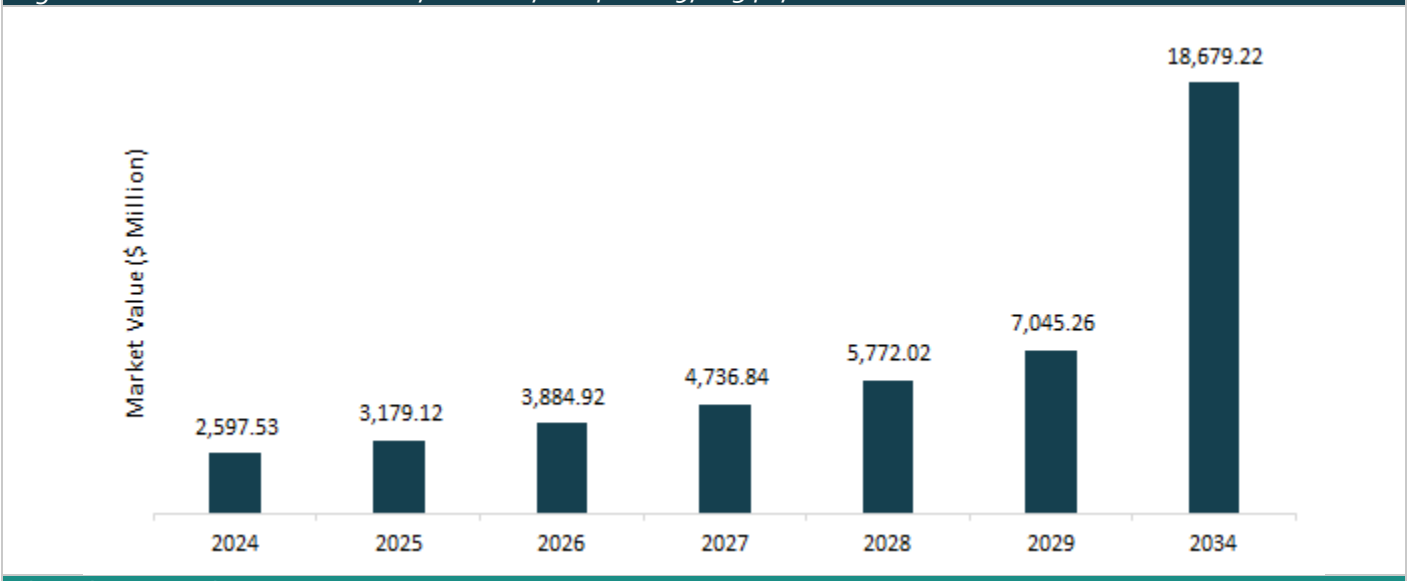

In the historic period, limited awareness among general population significantly hindered the growth of the MASH treatment market. Many individuals with early-stage MASH—often asymptomatic or misattributed to general fatigue or obesity remain undiagnosed until advanced liver damage occurs. This lack of public knowledge about MASH, its link to metabolic disorders (e.g., diabetes, obesity) and its potential to progress to cirrhosis or liver cancer reduces screening rates and delays treatment initiation. Primary care physicians, too, may overlook early signs due to insufficient education on MASH diagnostics, further exacerbating underreporting. For example, in 2024, a survey by the Global Liver Institute found that only 18% of respondents could correctly identify MASH as a liver disease, while over 60% mistakenly associated it primarily with obesity rather than metabolic dysfunction. This knowledge gap delays diagnosis, as early-stage MASH is often asymptomatic.[lx] Therefore, limited awareness among general population hindered the MASH treatment market growth.

© The Business Research Company 2025, All Rights Reserved

6.5 Forecast Market Growth, 2024 – 2029, 2034F Value ($ Million)

The chart and table below show the year-on-year growth of the MASH treatment forecast market during 2024 – 2029, 2034F.

Figure 6: MASH Treatment Market, Forecast, 2024 – 2029, 2034F , $ Million

The Business Research Company
Sources: National Statistics Offices, UN Comtrade, TBRC Analysis, TBRC Estimates, TBRC Secondary

Table 2: MASH Treatment Market, Forecast, 2024 – 2029, 2034F , $ Million

Market	2024	2025	2026	2027	2028	2029	2034	CAGR (2024 – 2029)	CAGR (2029 – 2034)
MASH Treatment	2,597.53	3,179.12	3,884.92	4,736.84	5,772.02	7,045.26	18,679.22	22.09%	21.53%

The Business Research Company
Sources: National Statistics Offices, UN Comtrade, TBRC Analysis, TBRC Estimates, TBRC Secondary

The global MASH treatment market is expected to grow from $2,597.53 million in 2024 to $7,045.26 million in 2029 at a compound annual growth rate (CAGR) of 22.09%. The market is expected to grow to $18,679.22 million in 2034 at a compound annual growth rate (CAGR) of 21.53%. The exponential growth in the forecast period can be attributed to the growing interest in combination therapies, increasing incidence of non-alcoholic fatty liver disease (NAFLD), rising demand for liver transplants and rising prevalence of obesity. For instance, in March 2022, according to the World Health Organization, a Switzerland-based specialized agency of the United Nations, around the world, 650 million adults, 340 million teenagers and 39 million children are obese. The WHO estimates that 167 million adults and children who are overweight or obese may experience some health problems by 2025.[lxi] Obesity is recognized as a major risk factor for Metabolic Dysfunction-Associated Steatohepatitis (MASH), as it significantly contributes to the buildup of fat in the liver, potentially leading to liver inflammation and fibrosis. The steadily increasing global prevalence of obesity, especially within urban populations, is resulting in a higher number of individuals being susceptible to MASH.

6.6 Forecast Growth Contributors/Factors

This section describes the MASH treatment driving the market, showcasing key factors influencing its expansion. By highlighting pivotal elements such as historic market trend, GDP growth, growth influence from key drivers and restraints, this visual representation provides a clear and concise overview of the diverse dynamics shaping the market's upward trajectory.

The table below shows the global MASH treatment market growth contributors, during 2024 – 2028.

Table 1: Global MASH Treatment Market, Growth Contributors, %

	Year				
Growth Contributor	2024	2025	2026	2027	2028
Historic Trend	16.13%	16.13%	16.13%	16.13%	16.13%
Forecast YoY GDP Growth	6.50%	6.21%	6.02%	5.75%	5.67%
Growing Interest in Combination Therapies	1.50%	1.50%	1.50%	1.50%	1.50%
Increasing Incidence of NAFLD	1.00%	1.00%	1.00%	1.00%	1.00%
Growing Prevalence of Obesity	0.75%	0.75%	0.75%	0.75%	0.75%
Rising Demand for Liver Transplants	0.50%	0.50%	0.50%	0.50%	0.50%
High Cost of Emerging Treatments	-1.95%	-2.00%	-2.00%	-2.00%	-2.00%
Limited Biomarker Availability	-1.45%	-1.50%	-1.50%	-1.50%	-1.50%
Impact of Trade War and Tariffs	-	-0.20%	-0.20%	-0.20%	-0.20%
Overall Market Growth	22.99%	22.39%	22.20%	21.93%	21.85%

The Business Research Company
Sources: National Statistics Offices, UN Comtrade, TBRC Analysis, TBRC Estimates, TBRC Secondary

6.6.1 Quantitative Growth Contributors

The key quantitative factors and their growth contributor percentages driving the market include:

Historic Trend – The growth trend of the market for the previous 10 years forms the base line of the forecast (GDP growth is removed from the historic trend to avoid double counting). The historic trend growth contributor from the last 10 years is **16.13%**

Forecast YoY GDP Growth – The year-on-year GDP growth rates obtained from the IMF GDP estimates outlook. The forecast YoY GDP growth contributor is **6.50%** in 2024 and is expected to vary across years based on IMF projections.

© The Business Research Company 2025, All Rights Reserved

6.6.2 Drivers

The key qualitative factors and their growth contributor percentages driving the market include:

Growing Interest In Combination Therapies - Growing interest in combination therapies is expected to be a key driver of the growth of the MASH treatment market in the forecast period. MASH involves intertwined pathological processes, including steatosis, inflammation, fibrosis and metabolic dysregulation, making single-agent therapies often insufficient for robust efficacy. Combination therapies, which simultaneously address multiple pathways (such as pairing an FXR agonist for metabolic regulation with an anti-fibrotic or anti-inflammatory agent), have shown promise in improving histological outcomes and halting disease progression. Clinical trials increasingly focus on synergistic drug pairs, such as GLP-1 receptor agonists with THR-β agonists, to enhance metabolic benefits while reducing liver injury.[lxii] The growing interest in combination therapies growth contribution during the forecast period in 2024 is **1.50%.**

Increasing Incidence Of Non-Alcoholic Fatty Liver Disease (NAFLD) - During the forecast period, the increasing incidence of non-alcoholic fatty liver disease (NAFLD) will propel the growth of the MASH treatment market. With rising global rates of obesity, type 2 diabetes and metabolic syndrome, NAFLD prevalence has surged, leading more patients to progress to MASH, a more severe form characterized by liver inflammation and fibrosis. This epidemiological shift has amplified the need for treatments that can prevent disease progression to cirrhosis, liver failure, or hepatocellular carcinoma. Pharmaceutical and biotech companies are responding by accelerating the development of anti-fibrotic, anti-inflammatory and metabolic-targeting drugs, with several candidates in late-stage clinical trials.[lxiii] The increasing incidence of non-alcoholic fatty liver disease (NAFLD) growth contribution during the forecast period in 2024 is **1.00%**.

Growing Prevalence Of Obesity - During the forecast period, growing prevalence of obesity will propel the growth of the MASH treatment market. Excess adiposity, particularly visceral fat, drives insulin resistance, chronic inflammation and dyslipidemia—key mechanisms that contribute to hepatic fat accumulation, liver injury and fibrosis. With global obesity rates rising sharply, the pool of at-risk individuals for MASH is expanding rapidly, increasing the demand for effective therapies. This epidemiological trend has spurred pharmaceutical and biotech investments in drugs targeting metabolic pathways (GLP-1 agonists, THR-β agonists) and antifibrotic agents to halt disease progression.[lxiv] The growing prevalence of obesity growth contribution during the forecast period in 2024 is **0.75%.**

Rising Demand For Liver Transplants - Rising demand for liver transplants is expected to be a key driver of the growth of the MASH treatment market in the forecast period. As MASH progresses, it can lead to advanced fibrosis, cirrhosis and liver failure, making transplantation the only viable option for many patients. However, the shortage of donor livers, high costs and post-transplant complications have intensified the need for effective pharmacological interventions that can halt or reverse disease progression before transplantation becomes necessary. This urgency has spurred accelerated R&D in MASH therapeutics, with pharmaceutical companies focusing on anti-fibrotic, metabolic and anti-inflammatory drugs to prevent liver deterioration. Additionally, healthcare systems and insurers are increasingly incentivizing early treatment to reduce the long-term burden of transplant-related expenses.[lxv] The rising demand for liver transplants growth contribution during the forecast period in 2024 is **0.50%.**

© The Business Research Company 2025, All Rights Reserved

6.6.3 Restraints

The key qualitative factors and their growth influencing percentages restricting the market include:

High Cost Of Emerging Treatments - High cost of emerging treatments is restricting the growth of the MASH treatment market during the forecast period. Novel MASH drugs, such as FXR agonists, THR-β modulators and combination therapies, often carry premium price tags due to extensive R&D investments, complex clinical trials and the need for long-term efficacy and safety data. Many healthcare systems, particularly in cost-sensitive markets, are hesitant to reimburse these expensive therapies without demonstrable long-term benefits (e.g., reduced liver transplants or mortality). The lack of cost-effective diagnostic tools for widespread screening means fewer patients are identified early, further limiting the eligible treatment pool.[lxvi] Growth affected by high cost of emerging treatments during the forecast period in 2024 is **-1.95%.**

Limited Biomarker Availability - Limited biomarker availability is restricting the growth of the MASH treatment market during the forecast period. Liver biopsy remains the gold standard for diagnosing and staging MASH, but its invasive nature, high cost and variability limit widespread use. Non-invasive biomarkers—such as blood-based tests or imaging techniques—are either insufficiently validated or lack sensitivity to detect early-stage disease or subtle treatment responses. This diagnostic gap delays timely intervention, leaving many patients undiagnosed until advanced fibrosis develops. Additionally, the absence of reliable biomarkers complicates clinical trial design, as researchers struggle to identify suitable endpoints or monitor drug efficacy efficiently. Without robust biomarkers, pharmaceutical companies face higher development risks and costs, discouraging investment in novel therapies.[lxvii] Growth affected by limited biomarker availability during the forecast period in 2024 is **-1.45%**.

Impact of Trade War and Tariff - Impact of trade war and tariffs restricting the growth of the MASH treatment market during the forecast period. Tariffs on pharmaceutical ingredients, medical devices and biologics—particularly those exchanged between major markets like the U.S., China and the EU—have escalated manufacturing expenses, forcing companies to either absorb higher costs or pass them on to healthcare systems and patients. Additionally, trade barriers hinder the seamless transfer of raw materials, APIs (active pharmaceutical ingredients) and specialized equipment needed for MASH drug production, leading to supply shortages and slower commercialization.[lxviii] Growth affected by impact of trade war and tariff during the forecast period in 2025 is **-0.20%**.

© The Business Research Company 2025, All Rights Reserved

6.7 MASH Treatment Total Addressable Market (TAM)

The total addressable market (TAM) for the MASH treatment market refers to the overall revenue opportunity available for pharmaceutical companies and healthcare providers if all individuals affected by MASH were to receive treatment. This includes the full spectrum of potential patients across all disease stages—ranging from early fatty liver conditions (MASLD) to advanced fibrosis, cirrhosis, and liver failure. TAM considers the global prevalence of MASH, diagnostic rates, treatment eligibility, and the cost of therapeutic interventions such as anti-fibrotic agents, GLP-1 receptor agonists, and lifestyle management programs. It represents the upper limit of market demand in an ideal scenario of complete access and adoption of MASH treatments.

The table below show the TAM of the global MASH treatment in 2024 and 2034.

Table 3: Global MASH Treatment Market TAM, 2024 And 2034, $ Million

Market	2024	2034
MASH Treatment	8,635	47,238

The Business Research Company
Sources: National Statistics Offices, UN Comtrade, TBRC Analysis, TBRC Estimates, TBRC Secondary

The TAM for MASH treatment accounted for $8,635 million in 2024 and is expected to reach $47,238 million in 2034, representing more than a five-fold increase over ten years. This sharp rise reflects growing global awareness and diagnosis of MASH, advances in treatment options (such as novel anti-fibrotic and metabolic therapies), and increasing prevalence driven by lifestyle-related conditions like obesity and type 2 diabetes. The expansion also indicates untapped demand and a strong commercial opportunity for pharmaceutical companies, especially as more targeted and effective therapies enter the market and access to care improves globally.

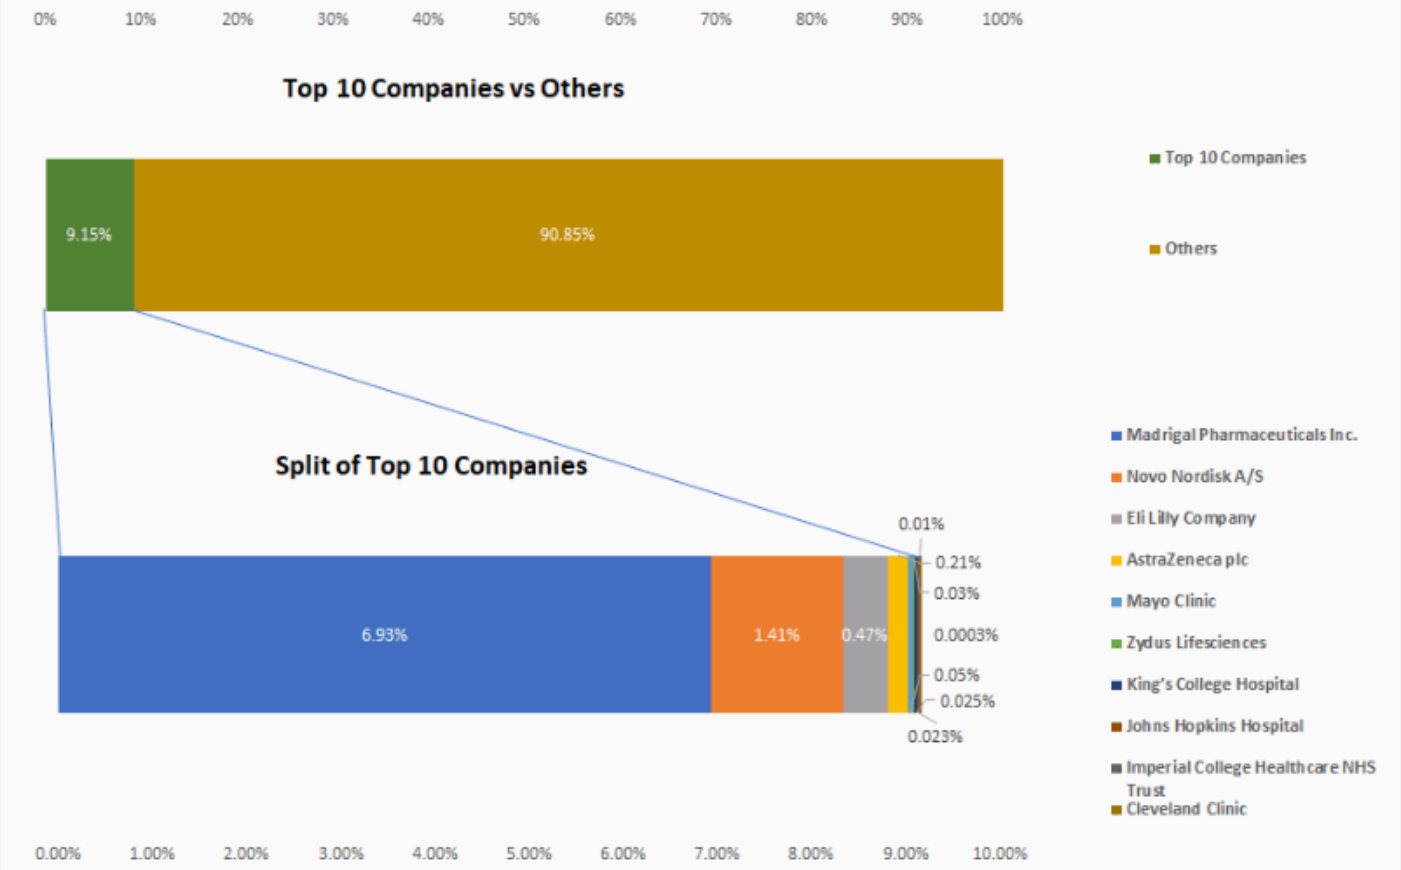

© The Business Research Company 2025, All Rights Reserved

7. Competitive Landscape And Company Profiles

The global MASH treatment markets is fragmented, with large number of players operating in the market. The top 10 competitors in the market made up 9.15% of the total market in 2024. Madrigal Pharmaceuticals Inc. was the largest competitor with a 6.93% share of the market, followed by Novo Nordisk A/S with 1.41%, Eli Lilly Company with 0.47%, AstraZeneca plc with 0.21%, Mayo Clinic with 0.05%, Zydus Lifesciences with 0.03%, King's College Hospital with 0.025%, Johns Hopkins Hospital with 0.023%, Imperial College Healthcare NHS Trust with 0.01% and Cleveland Clinic with 0.0003%.

The figure below displays the percentage market shares of the top players in the *MASH* treatment market.

Madrigal **Pharmaceuticals Inc.** generated estimated revenue of $180.00 million for the financial year 2024 from this market.

Novo Nordisk A/S generated estimated revenue of $36.72 million for the financial year 2024 from this market, a 25.03% increase from the previous year.

Eli Lilly Company estimated revenue of $12.22 million for the financial year 2024 from this market, a 41.42% increase from the previous year.

AstraZeneca plc generated estimated revenue of $5.41 million for the financial year 2024 from this market, a 18.03% increase from the previous year.

Mayo Clinic generated estimated revenue of $1.20 million for the financial year 2024 from this market.

Zydus Lifesciences generated estimated revenue of $0.72 million for the financial year 2024 from this market.

King's College Hospital generated estimated revenue of $0.64 million for the financial year 2024 from this market.

Johns Hopkins Hospital generated estimated revenue of $0.60 million for the financial year 2024 from this market.

Imperial College Healthcare NHS Trust generated estimated revenue of $0.22 million for the financial year 2024 from this market.

Cleveland Clinic generated estimated revenue of $0.01 million for the financial year 2024 from this market.

7.1 Company Profiles

7.2 *Madrigal* Pharmaceuticals Inc.

7.2.1 Company Overview

Madrigal Pharmaceuticals Inc. was the largest competitor in the *MASH* treatment market in 2024, with a 6.93% share of the market. Founded in 2011 and headquartered in Pennsylvania, United States, Madrigal Pharmaceuticals focuses on the development and commercialization of innovative therapies for cardiovascular and metabolic diseases, particularly targeting nonalcoholic steatohepatitis and related liver disorders.[lxix]

7.2.2 Products And Services

The division of the company completely involved in the MASH treatment market include:

Its lead candidate, Resmetirom (MGL-3196), is a selective thyroid hormone receptor-β (THR-β) agonist in late-stage development for treating MASH and lipid disorders. The drug aims to reduce liver fat, inflammation, and fibrosis, key pathological features of *MASH*. *Madrigal* is committed to addressing the unmet clinical needs of *MASH* patients with a once-daily oral therapy that targets the underlying metabolic dysfunction.[lxx]

7.2.3 Business Strategy

Madrigal Pharmaceuticals Inc.'s growth strategy focuses on expanding its business capabilities through advancement technology to expand its operational capabilities. For example, in March 2024, Madrigal Pharmaceuticals Inc. has approved Rezdiffra, an oral THR-β agonist, for treating NASH (also known as "MASH") patients with moderate to advanced liver fibrosis, based on Phase 3 data showing improved liver fibrosis and resolved NASH.[lxxi]

7.2.4 Financial Overview

The table below show the financial performance of Madrigal Pharmaceuticals Inc. in 2024

Table 01 Madrigal Pharmaceuticals Inc. – Financial Overview, 2024, $ Million

Year	2024
Revenue	180.00

The Business Research Company
Sources: Annual Reports[lxxii] TBRC Estimates, TBRC Analysis

Madrigal Pharmaceuticals Inc. had revenue of $180.00 million for the financial year 2024.[lxxiii]

Madrigal Pharmaceuticals Inc. generated estimated revenues of $180.00 million from the *MASH* treatment market, during the financial year 2024. The revenues are TBRC estimates based on the various services offered by the company as none of the divisions directly align with the market. It had a market capitalization of $6.66 billion as of 2025.[lxxiv]

7.3 Novo Nordisk A/S

7.3.1 Company Overview

Novo Nordisk A/S was the second largest competitor in the MASH treatment market in 2024, with an 1.41% share of the market. Established in 1923 and headquartered in Bagsvaerd, Denmark, Novo Nordisk is a global healthcare company engaged in the discovery, development, and production of pharmaceutical products and services, primarily for diabetes, obesity, and rare blood and endocrine disorders.[lxxv]

7.3.2 Products And Services

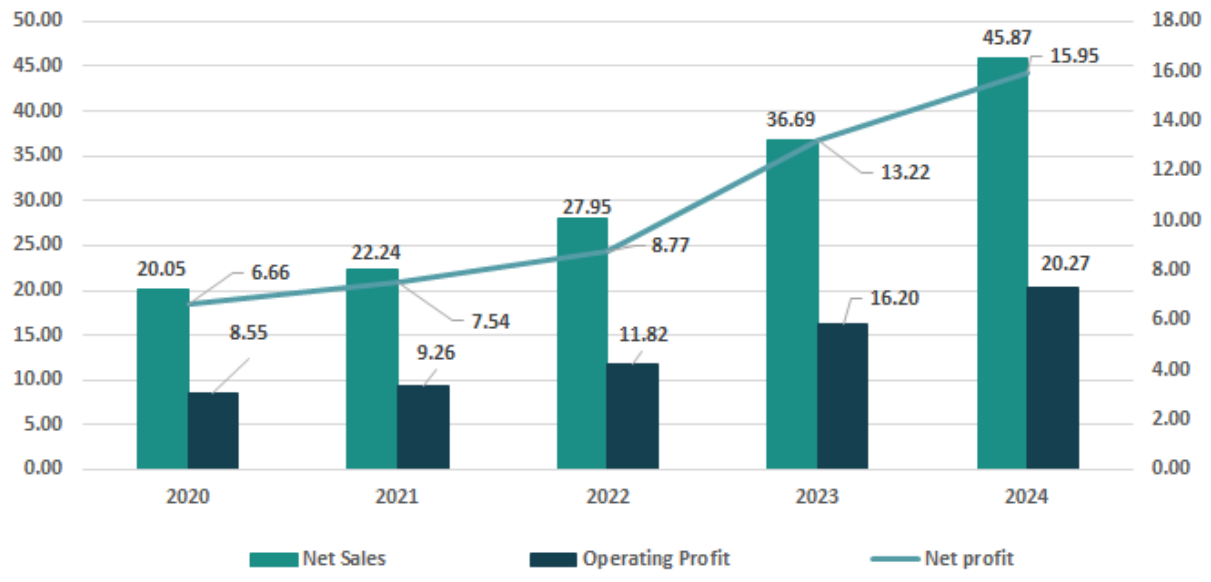

The division of the company partially involved in the MASH treatment market include:

Novo Nordisk, a provider in diabetes and metabolic disease treatments, has expanded its portfolio to address MASH through investigational GLP-1 receptor agonists and other metabolic agents. The company is developing semaglutide and other pipeline compounds targeting liver fat reduction, weight loss, and inflammation. Leveraging its expertise in obesity and diabetes care, Novo Nordisk aims to provide comprehensive therapeutic strategies that address MASH as part of a broader metabolic syndrome.[lxxvi]

7.3.3 Financial Overview

The chart and table below show the financial overview of Novo Nordisk A/S during 2020 – 2024.

Figure 02: Novo Nordisk A/S – Financial Overview, 2020 – 2024, $ Billion

The Business Research Company

Year	**2020**	**2021**	**2022**	**2023**	**2024**	**CAGR**
Net Sales	20.05	22.24	27.95	36.69	45.87	22.98%
Operating Profit	8.55	9.26	11.82	16.20	20.27	24.09%
Net profit	6.66	7.54	8.77	13.22	15.95	24.42%
The Business Research Company ***Sources: Annual Reports[lxxviii] TBRC Estimates, TBRC Analysis***						

Novo Nordisk A/S had net sales of $20.05 billion for the financial year 2020 and $45.87 billion in 2024. It had a market capitalization of $310.37 billion as of 2025.[lxxix]

Novo Nordisk A/S had operating profit of $8.55 billion for the financial year 2020 and $20.27 billion in 2024.

Novo Nordisk A/S had net profit for the period of $6066 billion for the financial year 2020 and $15.95 billion in 2024.

Novo Nordisk A/S generated estimated revenues of $36.72 million from the MASH treatment market, during the financial year 2024. The revenues are TBRC estimates based on the various products offered by the company as none of the divisions directly align with the market.

7.4 Eli Lilly Company

7.4.1 Company Overview

Eli Lilly Company was the third largest competitor in the MASH treatment market in 2024, with a 0.47% share of the market. Founded in 1876 and based in Indiana, United States, Eli Lilly is a multinational pharmaceutical company involved in the research, development, manufacturing, and marketing of human pharmaceuticals across therapeutic areas such as diabetes, oncology, immunology, and neuroscience.[lxxx]

7.4.2 Products And Services

The division of the company partially involved in the MASH treatment market include:

Eli Lilly is advancing clinical candidates for MASH, including dual and triple incretin receptor agonists such as tirzepatide. These agents are designed to improve glycemic control, reduce liver steatosis, and mitigate inflammation and fibrosis. The company is also exploring complementary metabolic and anti-inflammatory mechanisms to target multiple pathways involved in MASH progression. Lilly's approach integrates weight loss, insulin sensitization, and hepatic benefits to address the disease holistically.[lxxxi]

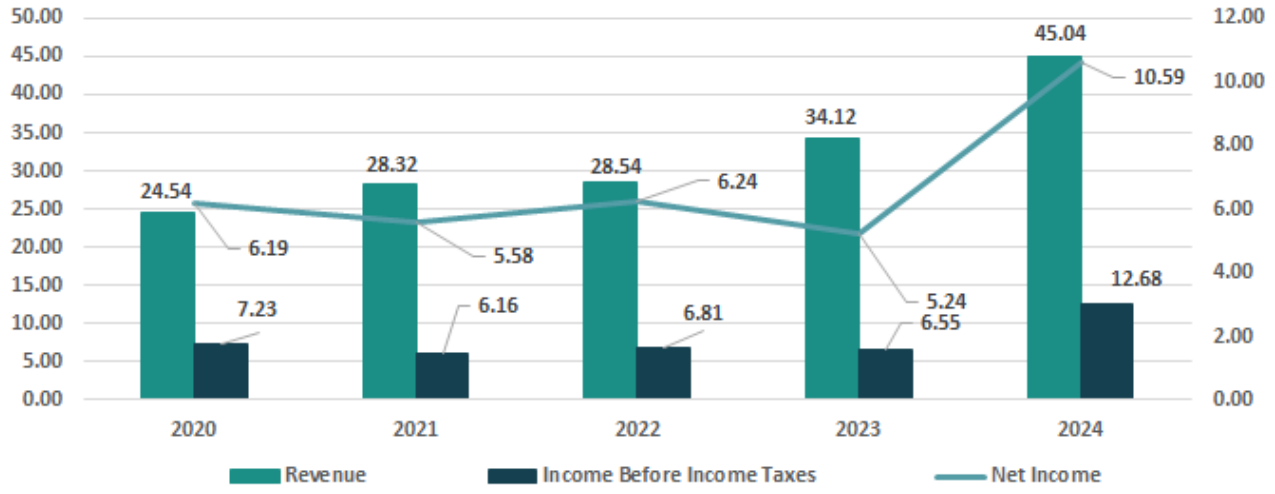

7.4.3 Business Strategy

Eli Lilly Company's growth strategy focuses on expanding its business capabilities through partnership to expand its operational capabilities. For example, in February 2025, Eli Lilly Company has signed a $660M global licensing agreement with Olix Pharmaceuticals. The aim of this strategic agreement is for OLX75016, a Phase 1 treatment candidate for MASH and other cardiometabolic diseases, valued at approximately 910 billion won ($660 million).[lxxxii]

7.4.4 Financial Overview

The chart and table below show the financial overview of Eli Lilly Company during 2020 – 2024.

Figure 03: Eli Lilly Company – Financial Overview, 2020 – 2024, $ Billion

The Business Research Company
Sources: Annual Reports[lxxxiii] **TBRC Estimates, TBRC Analysis**

Year	**2020**	**2021**	**2022**	**2023**	**2024**	**CAGR**
Revenue	24.54	28.32	28.54	34.12	45.04	16.40%
Income Before Income Taxes	7.23	6.16	6.81	6.55	12.68	15.08%
Net Income	6.19	5.58	6.24	5.24	10.59	14.35%
The Business Research Company ***Sources: Annual Reports[lxxxiv] TBRC Estimates, TBRC Analysis***						

Eli Lilly Company had revenue of $24.54 billion for the financial year 2020 and $45.04 billion in 2024. It had a market capitalization of $699.58 billion as of 2025.[lxxxv]

Eli Lilly Company had income before income taxes of $7.23 billion for the financial year 2020 and $12.68 billion in 2024.

Eli Lilly Company had net income, end of year of $6.19 billion for the financial year 2020 and $10.59 billion in 2024.

Eli Lilly Company generated estimated revenues of $12.22 million from the MASH treatment market, during the financial year 2024. The revenues are TBRC estimates based on the various products offered by the company as none of the divisions directly align with the market.

7.5 AstraZeneca plc

7.5.1 Company Overview

AstraZeneca plc was the fourth largest competitor in the MASH treatment market in 2024, with a 0.21% share of the market. Established in 1999 through a merger and headquartered in Cambridge, United Kingdom, AstraZeneca is a global biopharmaceutical company focused on the discovery, development, and commercialization of prescription medicines in areas such as oncology, cardiovascular, renal, metabolism, and respiratory.[lxxxvi]

7.5.2 Products And Services

The division of the company partially involved in the MASH treatment market include:

The company is investigating compounds such as cotadutide, a dual GLP-1/glucagon receptor agonist, for their potential to improve liver histology and metabolic markers. AstraZeneca's pipeline includes novel small molecules and biologics that target insulin resistance, inflammation, and fibrosis. The company also supports real-world evidence generation and clinical trials to better understand MASH pathogenesis and treatment outcomes.[lxxxvii]

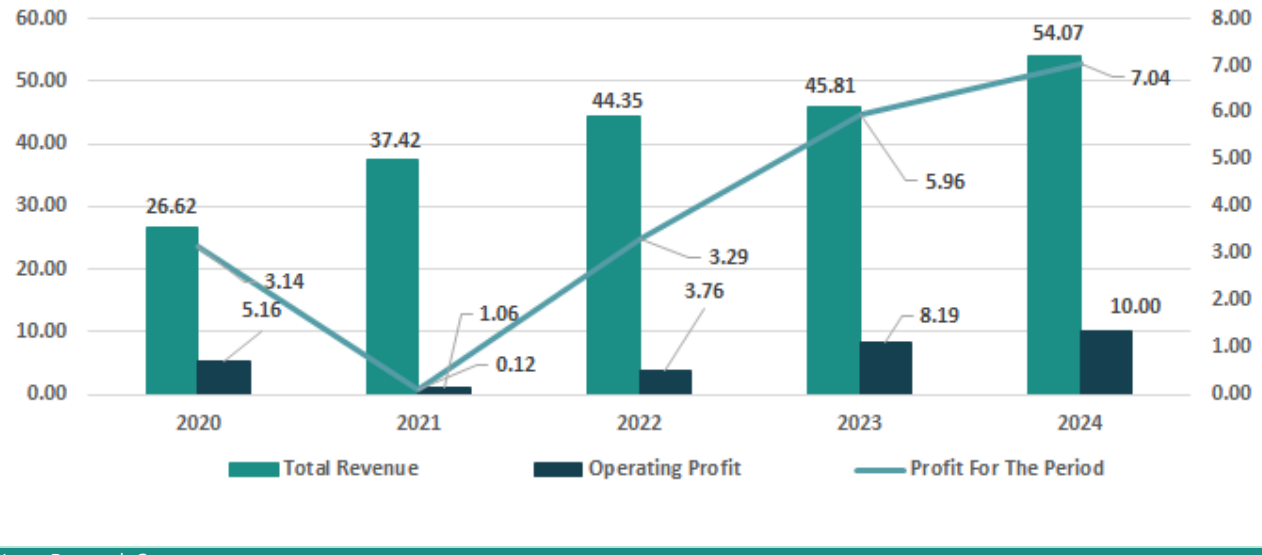

7.5.3 Business Strategy

AstraZeneca Plc's growth strategy focuses on expanding its business capabilities through strategic acquisition to expand its operational capabilities. For example, in September 2024, AstraZeneca Plc acquired Fusion Pharmaceuticals for $2.4B, potentially accelerating the development of FPI-2265, a new prostate cancer treatment approved by the FDA.[lxxxviiilxxxix]

7.5.4 Financial Overview

The chart and table below show the financial overview of AstraZeneca plc during 2020 – 2024.

Figure 04: AstraZeneca plc – Financial Overview, 2020 – 2024, $ Billion

The Business Research Company

Year	**2020**	**2021**	**2022**	**2023**	**2024**	**CAGR**
Total Revenue	26.62	37.42	44.35	45.81	54.07	19.39%
Operating Profit	5.16	1.06	3.76	8.19	10.00	17.99%
Profit For The Period	3.14	0.12	3.29	5.96	7.04	22.33%
The Business Research Company ***Sources: Annual Reports[xci] TBRC Estimates, TBRC Analysis***						

AstraZeneca plc had total revenue of $26.62 billion for the financial year 2020 and $54.07 billion in 2024. It had a market capitalization of $221.36 trillion as of 2025.[xcii]

AstraZeneca plc had operating profit of $5.16 billion for the financial year 2020 and $10.00 billion in 2024.

AstraZeneca plc had profit for the period of $3.14 billion for the financial year 2020 and $7.04 billion in 2024.

AstraZeneca plc generated estimated revenues of $5.41 million from the MASH treatment market, during the financial year 2024. The revenues are TBRC estimates based on the various products offered by the company as none of the divisions directly align with the market.

© The Business Research Company 2025, All Rights Reserved

7.6 Mayo Clinic

7.6.1 Company Overview

Mayo Clinic was the fifth largest MASH treatment market in 2024, with a 0.05% share of the market. Founded in 1864 and headquartered in Minnesota, United States, Mayo Clinic is a nonprofit academic medical center that integrates clinical practice, education, and research, offering specialized medical services across multiple locations and recognized for patient-centered care.[xciii]

7.6.2 Products And Services

The division of the company partially involved in the MASH treatment market include:

Mayo Clinic provides comprehensive diagnostic, therapeutic, and research services for MASH patients. It operates multidisciplinary clinics integrating hepatology, endocrinology, and nutrition to deliver personalized care. The institution participates in clinical trials and translational research aimed at identifying biomarkers, testing novel pharmacological therapies, and refining non-invasive diagnostic tools. Mayo Clinic is recognized for its leadership in MASH-related liver disease management and innovation.[xciv]

7.6.3 Financial Overview

The table below show the financial performance of Mayo Clinic in 2024

Table 5: Mayo Clinic – Financial Overview, 2024, $ Billion

Year	2024
Revenue	17.00

The Business Research Company
Sources: Annual Reports[xcv] TBRC Estimates, TBRC Analysis

Mayo Clinic had revenue of $17.00 billion for the financial year 2024.[xcvi]

Mayo Clinic generated estimated revenues of $1.20 million from the MASH treatment market, during the financial year 2024. The revenues are TBRC estimates based on the various services offered by the company as none of the divisions directly align with the market.

8. Other Major And Innovative Companies

8.1 Zydus Lifesciences

8.1.1 Company Overview

Founded in 1952 and based in Ahmedabad, India, Zydus Lifesciences is a global pharmaceutical company engaged in the research, development, manufacturing, and marketing of a wide range of healthcare therapies including generics, specialty drugs, and biologics.[xcvii]

8.1.2 Products And Services

Zydus Lifesciences is developing Saroglitazar Magnesium, a novel peroxisome proliferator-activated receptor (PPAR) agonist targeting both PPARα and PPARγ, for treating MASH. The drug is designed to reduce hepatic fat content, improve insulin sensitivity, and mitigate inflammation. Zydus is actively conducting global clinical trials to evaluate Saroglitazar's efficacy and safety in MASH patients. Its approach combines drug innovation with affordable access to emerging treatments for liver-related metabolic disorders.[xcviii]

8.2 King's College Hospital

8.2.1 Company Overview

Founded in 1840 and located in London, United Kingdom, King's College Hospital is a major teaching and tertiary care hospital offering a comprehensive range of medical services and serving as a hub for medical research and clinical education.[xcix]

8.2.2 Products And Services

It provides integrated clinical services supported by advanced diagnostics and fibrosis assessment tools. The hospital is involved in clinical research focused on new therapeutic agents and non-invasive diagnostic modalities. Through collaborations with academia and industry, it contributes to the validation and deployment of MASH treatment pathways.[c]

8.3 Johns Hopkins Hospital

8.3.1 Company Overview

Established in 1889 and based in Baltimore, United States, Johns Hopkins Hospital is an academic medical and research institution that provides specialized medical care and is affiliated with Johns Hopkins University for advancing medical education and innovation.[ci]

© The Business Research Company 2025, All Rights Reserved

8.3.2 Products And Services

Johns Hopkins Hospital offers state-of-the-art diagnosis and management of MASH through its hepatology and metabolic liver disease programs. It engages in cutting-edge research to evaluate novel biomarkers, imaging techniques, and pharmacotherapies for MASH. The institution is a hub for clinical trials exploring anti-fibrotic and metabolic therapies. Johns Hopkins combines academic research with patient care to advance the understanding and treatment of MASH.[cii]

8.4 Imperial College Healthcare NHS Trust

8.4.1 Company Overview

Formed in 2007 and headquartered in London, United Kingdom, Imperial College Healthcare is one of the largest National Health Service trusts, operating several hospitals and providing a wide range of acute and specialist healthcare services in partnership with Imperial College London.[ciii]

8.4.2 Products And Services

It offers multidisciplinary management including hepatology, endocrinology, and dietetics, alongside participation in international MASH drug trials. The trust also supports non-invasive assessment and digital health innovations to monitor disease progression and treatment response.[civ]

8.5 Cleveland Clinic

8.5.1 Company Overview

Founded in 1921 and based in Ohio, United States, Cleveland Clinic is a nonprofit academic medical center known for providing comprehensive clinical and hospital care, pioneering medical research, and operating several healthcare facilities domestically and internationally.[cv]

8.5.2 Products And Services

It is engaged in both investigator-initiated and industry-sponsored clinical trials testing emerging pharmacotherapies. The clinic offers advanced diagnostic services including transient elastography and liver MRI, along with lifestyle intervention programs. Cleveland Clinic's research and clinical infrastructure supports development and validation of novel treatment algorithms for MASH.[cvi]

8.6 HighTide Therapeutics Inc.

8.6.1 Company Overview

Established in 2011 and headquartered in Maryland, United States, HighTide Therapeutics is a clinical-stage biopharmaceutical company developing multi-target therapies for chronic diseases including metabolic and gastrointestinal disorders.[cvii]

8.6.2 Products And Services

Its lead product, HTD1801, is a new molecular entity with anti-inflammatory and lipid-lowering properties, currently in Phase II trials. HTD1801 targets metabolic pathways and gut-liver axis dysfunctions to reduce hepatic fat accumulation and fibrosis. The company is also developing other pipeline assets to address the multifactorial nature of MASH.[cviii]

© The Business Research Company 2025, All Rights Reserved

8.7 Sagimet Biosciences

8.7.1 Company Overview

Founded in 2006 and based in California, United States, Sagimet Biosciences is a clinical-stage biotechnology company focused on developing therapeutics that target dysfunctional metabolic pathways, particularly for liver and oncology indications.[cix]

8.7.2 Products And Services

Sagimet Biosciences is developing Denifanstat (TVB-2640), an oral fatty acid synthase (FASN) inhibitor aimed at reducing liver steatosis and fibrosis in MASH patients. Denifanstat acts on lipid metabolism, a key driver in MASH pathology, and has shown promising results in Phase II trials. Sagimet is focusing on advancing this targeted therapy to address both early and advanced stages of the disease. Its research emphasizes molecular precision to improve liver health outcomes.[cx]

8.8 Rivus Pharmaceuticals

8.8.1 Company Overview

Established in 2019 and headquartered in Virginia, United States, Rivus Pharmaceuticals is a biopharmaceutical company developing therapies that address obesity, cardiovascular, and metabolic diseases by modulating mitochondrial function.[cxi]

8.8.2 Products And Services

Its lead compound, HU6, is a mitochondrial uncoupler designed to reduce hepatic fat, improve insulin sensitivity, and promote weight loss without increasing heart rate. The company's pipeline supports the treatment of MASH as part of broader cardiometabolic disease management. Rivus is advancing HU6 through clinical trials, positioning it as a differentiated option in the MASH landscape.[cxii]

8.9 89bio Inc.

8.9.1 Company Overview

Founded in 2018 and headquartered in California, United States, 89bio is a clinical-stage biopharmaceutical company focused on developing therapies for liver and cardio-metabolic diseases, with an emphasis on nonalcoholic steatohepatitis.[cxiii]

8.9.2 Products And Services

89bio Inc. is developing pegozafermin, a glycopegylated analog of fibroblast growth factor 21 (FGF21), to treat MASH and severe hypertriglyceridemia. Pegozafermin has shown potential to significantly reduce liver fat and improve inflammation and fibrosis. The therapy is being evaluated in Phase II and III trials, with a focus on long-term metabolic and hepatic outcomes. 89bio's approach addresses the endocrine and metabolic drivers of MASH.[cxiv]

© The Business Research Company 2025, All Rights Reserved

8.10 Dr. Falk Pharma

8.10.1 Company Overview

Established in 1960 and based in Freiburg, Germany, Dr. Falk Pharma specializes in the development and commercialization of pharmaceutical treatments for digestive and liver diseases, focusing on niche indications with unmet clinical needs.[cxv]

8.10.2 Products And Services

The company focuses on anti-inflammatory and anti-fibrotic drug development, with products supporting liver health and gut-liver axis modulation. While primarily recognized in Europe, it is active in advancing MASH-related therapeutic innovation through clinical collaborations.[cxvi]

8.11 Akero Therapeutics

8.11.1 Company Overview

Founded in 2017 and headquartered in California, United States, Akero Therapeutics is a clinical-stage biotechnology company developing transformational treatments for metabolic diseases, particularly targeting nonalcoholic steatohepatitis.[cxvii]

8.11.2 Products And Services

Akero Therapeutics is developing efruxifermin (EFX), an analog of FGF21, as a once-weekly injectable therapy for MASH. EFX targets metabolic dysfunction, liver inflammation, and fibrosis, with robust results demonstrated in Phase IIb trials. The therapy aims to reverse disease progression and improve overall liver function. Akero is focused on rapid clinical development and regulatory advancement of EFX for broad MASH patient populations.[cxviii]

8.12 NorthSea Therapeutics BV

8.12.1 Company Overview

Established in 2017 and headquartered in Amsterdam, Netherlands, NorthSea Therapeutics is a biotechnology company developing novel therapies derived from structural fatty acids for the treatment of metabolic, inflammatory, and fibrotic diseases.[cxix]

8.12.2 Products And Services

NorthSea Therapeutics is advancing icosabutate, a structurally engineered fatty acid, for the treatment of MASH. Icosabutate targets multiple disease pathways including lipid metabolism, inflammation, and fibrosis. The therapy has shown favorable safety and efficacy profiles in early clinical trials and is now in Phase IIb development. NorthSea's pipeline addresses unmet needs in liver and cardiometabolic diseases through novel oral therapies.[cxx]

8.13 Lipocine Inc.

8.13.1 Company Overview

Founded in 1997 and based in Utah, United States, Lipocine is a clinical-stage biopharmaceutical company developing oral drug delivery technologies for metabolic and endocrine disorders, including liver diseases and hormone deficiencies.[cxxi]

© The Business Research Company 2025, All Rights Reserved

8.13.2 Products And Services

Lipocine Inc. is developing LPCN 1144, an oral prodrug of testosterone, as a treatment for MASH in hypogonadal men. The therapy is designed to restore hormonal balance, reduce liver fat, and improve fibrosis markers. Clinical trials have demonstrated significant histological improvements in liver health. Lipocine's unique approach combines endocrine therapy with metabolic disease treatment, targeting a specific patient subset with high unmet need.[cxxii]

8.14 Cirius Therapeutics

8.14.1 Company Overview

Established in 2015 and headquartered in Michigan, United States, Cirius Therapeutics is a biopharmaceutical company focused on developing therapies targeting mitochondrial dysfunction to treat metabolic diseases such as nonalcoholic steatohepatitis.[cxxiii]

8.14.2 Products And Services

Cirius Therapeutics is developing MSDC-0602K, a next-generation insulin sensitizer targeting mitochondrial metabolism for treating MASH. The drug modulates cellular energy pathways without activating classical PPARγ, aiming to reduce inflammation and fibrosis while minimizing side effects. MSDC-0602K is in advanced clinical trials and has shown potential in improving insulin resistance and liver histology. Cirius focuses on metabolic correction to halt MASH progression.[cxxiv]

8.15 Alimentiv Inc.

8.15.1 Company Overview

Founded in 1986 and headquartered in Ontario, Canada, Alimentiv is a contract research organization specializing in gastrointestinal research, offering clinical trial services, real-world evidence studies, and precision medicine solutions to advance drug development.[cxxv]

8.15.2 Products And Services

It offers end-to-end services encompassing clinical trial design, imaging and pathology central reading, biomarker analysis, and regulatory support. Alimentiv supports drug developers by providing precision trial execution and data analysis for MASH studies. Its integrated approach accelerates therapeutic development while ensuring scientific and regulatory rigor.[cxxvi]

9.3 Research Methodology

The Business Research Company's reports are based on the methodology below.

Global Market Model (GMM)

The Global Market Model is a comprehensive database of integrated market information which covers historic, current, and forecast market information. This database helps in drawing multiple conclusions, exploring market opportunities and taking effective business decisions.

Global Market Model's methodology ensures that the data is of the highest quality. It starts with high standard data sources and correlation-based modelling techniques.

The datasets on the global market model are created using a wide range of proprietary and public sources including leading government bodies, associations, trade journals, market intelligence reports and trade magazines. Data is modelled based on hard data, extrapolation, regression analysis based on known macro data inputs, interpolation between hard figures, comparisons with other geographies and markets, price estimations, and qualitative inputs. Data is triangulated within our unique market data model covering an exhaustive list of 2500+ markets across 48 countries and 7 regions. Comparable data is used for sanity check and trend analysis. For example, our global market value data is compared to unit sales and price data for the relevant market as well as relevant macro-economic datasets in order to establish validity.

Company Financials

The financials of more than 3000 companies is tracked. By aligning their revenues with our market taxonomy, we are able to cross verify our market numbers and assess the concentration/fragmentation of the market landscape.

Competitor market share data is intended to represent the companies that gain the most revenues from the given market and the percentage share of the market that they hold. If a company derives most of its revenues from the market, its revenues are given in full. If a large part of the company's revenues come from other markets, only the division of the company which operates in this market is included. Where accurate information is not available on the revenues a company generates from the market its market share is not included, however a profile of the company may still be included if it is a significant competitor in the market.

Verification Through Expert Interviews –

The GMM database is supported by TBRC's market expertise and thousands of expert interviews conducted each year to verify the data. Every year The Business Research Company carries out thousands of interviews with senior executives and industry experts across hundreds of markets. Through these interviews we develop our internal understanding of markets and geographies and cross reference our understanding of global markets with expert feedback utilizing 'Delphic' research methodologies.

Industry Knowledge –

The data is managed by our global team of more than one hundred Research Consultants, boasting years of research and industry experience. We utilize Consultants based in more than 28 countries to gather data. Our consultants have been trained in research techniques and ethics by the Market Research Society and The Association of Internet Researchers.

Statistical Analysis –

Analysis is drawn from our consultants' wide range of industry and research experience as well as public and proprietary sources. Consultants are trained in research techniques and ethics by the Market Research Society.

We run hundreds of statistical tests on our data to find the strongest correlations between our sourced market data and correlated macro-economic datasets in order to ensure our data modelling is as accurate as possible.

We use the following techniques in our data estimates:

Correlation: Data gaps are filled using GDP, population, and value-added data as relevant to the market, including agricultural, industrial, and commercial value added.

Regression: Based on data for statistically correlated markets.

Extrapolation: Estimated from historic trend data.

Comparison: With related markets and countries for which hard data is available.

Alignment: Sub-markets are tallied with overall market sizes; country data is tallied with regional and global data.

Referencing –

The Business Research Company prides itself on the quality and validity of its data and analysis. Our unique 'end noted' referencing approach allows the user to trace our market numbers and analysis back to the specific data sources they were derived from.

Note on Currency Conversions –

All currency conversions are carried out on the basis of 2024 exchange rates.

9.4 Currencies

$ stands for US Dollar

€ stands for Euro

All other currencies are given with ISO currency codes.

Research Inquiries

If you have any inquiries relating the research services, please do not hesitate to get in touch.

Please contact info@tbrc.info for more information or call Europe +44 7882 955267, Asia +91 8897263534, Americas +1 310-496-7795.

9.5 The Business Research Company

The Business Research Company excels in competitor, market and consumer research on a range of industries globally. We have offices in the UK, US and Spain and consultants in 20+ countries globally. We use advanced secondary and investigative primary research techniques to find business critical information. Typical projects include helping clients find new customers, understand competitors and analyze markets.
